ACKNOWLEDGEMENT

I would like to express my sincere gratitude to **1Stop** for providing me with the opportunity to undertake the **Web Development Front-End Internship**. This internship has enhanced my practical knowledge of web development by allowing me to build real-world applications using HTML, CSS, and JavaScript.

I am thankful to the internship mentors and coordinators for their valuable guidance, encouragement, and continuous support throughout the completion of this project. Their suggestions helped me improve my understanding of front-end technologies and software development practices.

I also extend my sincere thanks to the faculty members of the **Institute of Engineering & Management (IEM), Kolkata**, for motivating me to enhance my technical knowledge and practical skills.

Finally, I express my heartfelt gratitude to my family and friends for their constant encouragement and support during the successful completion of this internship project.

ABSTRACT

The **Personal Expense Tracker** is a web-based application developed to help users record, organize, and monitor their daily expenses efficiently. The primary objective of this project is to provide a simple and user-friendly platform where users can add, view, and manage their financial transactions. Maintaining records of daily expenses helps individuals understand their spending habits and make informed financial decisions.

The application has been developed using **HTML5**, **CSS3**, and **JavaScript**. HTML5 provides the structural framework of the application, CSS3 is used to create an attractive and responsive user interface, and JavaScript manages the application's functionality, including adding expenses, calculating totals, updating records, and storing data.

The Expense Tracker provides an easy way to maintain personal financial records without the need for complex accounting software. It offers a clean interface, quick data entry, and an organized display of expenses, making it suitable for students, professionals, and individuals who wish to monitor their daily spending.

This project demonstrates practical implementation of front-end web development concepts while solving a real-life problem through an interactive web application.

OBJECTIVE

The main objective of the **Personal Expense Tracker** is to develop a simple, responsive, and interactive web application that allows users to record and manage their daily expenses efficiently.

The specific objectives of this project are:

- To develop an expense management system using HTML5, CSS3, and JavaScript.
- To provide a user-friendly interface for entering expense details.
- To calculate and display the total amount of expenses.
- To organize financial records in a structured manner.
- To improve practical knowledge of front-end web development.
- To understand DOM manipulation and event handling in JavaScript.
- To implement data storage for maintaining expense records.
- To develop a responsive application that works across different devices.
- To improve problem-solving and programming skills through project development.
- To create a practical application that can be used in everyday life.

INTRODUCTION

Managing personal finances is an essential part of everyday life. Recording daily income and expenses helps individuals understand their spending habits, plan budgets, and make better financial decisions. However, manually maintaining expense records in notebooks or spreadsheets can be time-consuming and prone to errors. A web-based Personal Expense Tracker provides a simple and efficient solution for organizing financial records.

The **Personal Expense Tracker** developed in this project is a front-end web application that enables users to add, view, and manage their daily expenses through a clean and interactive interface. The application has been developed using **HTML5**, **CSS3**, and **JavaScript**, which are widely used technologies for modern web development.

The application allows users to enter expense details, display a list of transactions, calculate the total expenditure, and manage financial records efficiently. The responsive design ensures that the application works properly on desktops, laptops, tablets, and smartphones, providing a consistent user experience across different devices.

Developing this project provided practical experience in creating responsive web interfaces, handling user inputs, manipulating the Document Object Model (DOM), and implementing interactive features using JavaScript. It also strengthened the understanding of front-end development principles and user interface design.

The Personal Expense Tracker demonstrates how simple web technologies can be used to create practical applications that solve real-life problems while improving programming and web development skills.

METHODOLOGY

The development of the Personal Expense Tracker followed a structured process to ensure that the application met all functional and design requirements.

Requirement Analysis

The first step involved identifying the essential features required in an expense tracking application. These included adding expenses, displaying transactions, calculating total expenditure, deleting records, and maintaining an organized interface.

Planning and Design

A simple and responsive layout was planned before implementation. Input fields, buttons, transaction lists, and summary sections were arranged to provide a clean and user-friendly interface.

Development

The application was developed using HTML5 for webpage structure, CSS3 for styling, and JavaScript for implementing dynamic functionality. JavaScript was used to validate user inputs, update expense records, calculate totals, and manage interactions.

Testing

The completed application was tested on different web browsers and screen sizes to verify proper functionality and responsive behavior. All major features were checked to ensure accurate calculations and smooth operation.

Deployment

After successful testing, the project files were organized and uploaded to GitHub for version control and future reference.

WORKING

The Personal Expense Tracker is designed to help users record and manage their daily expenses in a simple and efficient manner. The application follows a straightforward workflow that allows users to add, view, and manage expense records through an interactive interface.

The working of the project is explained below:

1. **The user opens the Expense Tracker application in a web browser.**
2. **The user enters the required expense details, such as the expense title, amount, and other necessary information.**
3. **After entering the details, the user clicks the Add Expense button.**
4. **JavaScript validates the entered information to ensure that all required fields are filled correctly and the amount entered is valid.**
5. **Once validated, the expense is added to the expense list and immediately displayed on the screen without reloading the webpage.**
6. **The application automatically updates the total expense amount whenever a new expense is added or an existing expense is removed.**
7. **If Local Storage is implemented, all expense records are saved in the browser, allowing the data to remain available even after refreshing or reopening the webpage.**
8. **Users can delete unwanted expense records using the Delete button, and the total expense amount is recalculated automatically.**
9. **The responsive design ensures that the application works smoothly on desktops, laptops, tablets, and smartphones.**
10. **The entire application operates on the client side using HTML, CSS, and JavaScript, making it lightweight, fast, and easy to use.**

CONCLUSION

The Personal Expense Tracker was successfully designed and developed using HTML5, CSS3, and JavaScript. The application provides a simple, responsive, and user-friendly platform for recording and managing daily expenses.

During the development of this project, practical knowledge of front-end web development was gained, including webpage design, responsive layouts, DOM manipulation, event handling, and dynamic data processing using JavaScript. The project also improved problem-solving abilities and strengthened programming skills through practical implementation.

The completed application helps users organize their financial records, monitor their daily spending, and maintain expense information efficiently. Its simple interface and responsive design make it suitable for everyday use across different devices.

Overall, the Personal Expense Tracker demonstrates how modern web technologies can be used to develop practical and useful applications while enhancing front-end development skills.
